**Answer all questions**

---

Assume, velocity of light ( $c$ ) =  $3 \times 10^8 \text{ ms}^{-1}$

**01.** Write down the **two** main Einstein's Postulates in Special Theory of Relativity (STR).

Obtain the following relativistic time equation, starting from the above postulates in STR.

$$t^1 = \gamma t , \quad \text{where, } \gamma = \left(1 - \frac{v^2}{c^2}\right)^{-1/2} ; \text{ (symbols have their usual meanings).}$$

The mean lifetime of stationary muons is measured to be 2.20 ms. The mean lifetime of high-speed muons in a burst of cosmic rays observed from Earth is measured to be 16.0 ms. What is the speed of these cosmic-ray muons relative to Earth?

**(25 Marks)**

Write down the **two** main Einstein's Postulates in Special Theory of Relativity (STR).

Obtain the following relativistic time equation, starting from the above postulates in STR.

$$t^1 = \gamma t , \quad \text{where } \gamma = \left(1 - \frac{v^2}{c^2}\right)^{-1/2} ; \text{ (symbols have their usual meanings).}$$

THIS IS COMPLETELY  
THEORY  
PART 1.

The mean lifetime of stationary muons is measured to be 2.20 ms. The mean lifetime of high-speed muons in a burst of cosmic rays observed from Earth is measured to be 16.0 ms. What is the speed of these cosmic-ray muons relative to Earth?

$$t_2 = t_1 \frac{1}{\sqrt{1 - \frac{v^2}{c^2}}}$$

```

Out[3]= 1.6
```

03.

Let us assume two objects **A** and **B** are moving in an opposite direction to each other with constant velocities  $\underline{V}_A$  and  $\underline{V}_B$  respectively. **Find the relative velocity of B** with respect to A,  $V_{(B,A)}$  starting from the Lorentz velocity transformation equation.

A particle moves along the  $x^1$  axis of frame  $S^1$  with velocity  $0.40 c$ . Frame  $S^1$  moves with velocity  $0.60 c$  with respect to frame  $S$ . What is the velocity of the particle with respect to frame  $S$ ?

*{You may assume that the Lorentz velocity transformation equation for the above case takes the following form;*

$$U_x^1 = \frac{U_x - v}{1 - \frac{v}{c^2} U_x}. \text{ Where symbols have their usual meanings. }$$

**(25 Marks)**

Let us assume two objects **A** and **B** are moving in an opposite direction to each other with constant velocities  $V_A$  and  $V_B$  respectively. Find the relative velocity of **B** with respect to **A**,  $V_{(B,A)}$  starting from the Lorentz velocity transformation equation.

### Relative Motion for the two bodies in Relativity

Let us assume two objects are moving in an opposite direction to each other,

Using Lorentz transformation equations;

$$U_x' = \frac{U_x - v}{1 - \frac{U_x v}{c^2}}$$

For this example;  $U_x^1 = V_A$ ,  $U_x = -V_B$  and  $v = V_{(B,A)}$

*Direction of B is opposite to the A*

$$U_x^1 = \frac{U_x - v}{1 - \frac{U_x v}{c^2}} \Rightarrow V_A = \frac{(-V_B) - v}{1 - \frac{(-V_B)v}{c^2}} \Rightarrow -v = \frac{V_A + V_B}{1 + \frac{V_A V_B}{c^2}}$$

*Theorem!*

$$-v = \frac{V_A + V_B}{1 + \frac{V_A V_B}{c^2}}$$

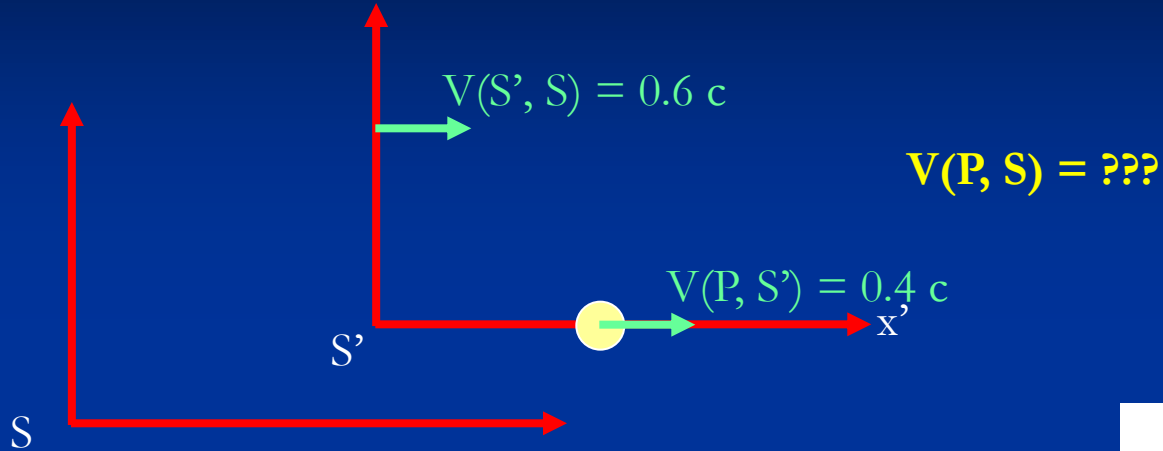

→ This  $v$  denotes  $V_{(B,A)}$ .  $V_{(B,A)}$  has a negative value. ∴ The direction of  $V_{(B,A)}$  should be the opposite direction. ∴  $V_{(A,B)}$  is +ve;

$$\rightarrow v = V_{(A,B)} = \frac{V_A + V_B}{1 + \frac{V_A V_B}{c^2}}$$

Or ←  $v = V_{(B,A)}$

A particle moves along the  $x^1$  axis of frame  $S^1$  with velocity  $0.40 c$ . Frame  $S^1$  moves with velocity  $0.60 c$  with respect to frame  $S$ . What is the velocity of the particle with respect to frame  $S$ ?

$$v = V_{(P,S)} = \frac{V_{P,S'} + V_{S',S}}{1 + \frac{V_{P,S'} V_{S',S}}{c^2}}$$

```

Untitled-1 * - Wolfram Mathematica 12.1
File Edit Insert Format Cell Graphics Evaluation Palettes Window Help

In[4]:= vpsd = 0.4 C
         vsds = 0.6 C
         v = (vpsd + vsds) / (1 + ((vsds * vpsd) / C^2))

Out[4]= 0.4 C

Out[5]= 0.6 C

Out[6]= 0.806452 C

```

- 04.** A spaceship, moving away from Earth at a speed of  $0.9c$ , reports back by transmitting a signal at a frequency (measured in the spaceship frame) of  $100 \text{ MHz}$ . **To what frequency** must Earth receivers be tuned to receive the report?

*{You may assume that the relationship between the observed frequency and the source frequency for the above case takes the following form;*

$$f_o = \frac{f_s}{\gamma (1 - \beta \cos \theta)}$$

*Where,  $\gamma = \frac{1}{\sqrt{1 - \beta^2}}$ ,  $\beta = \frac{v}{c}$  and other symbols have their usual meanings. }*

**(25 Marks)**

A spaceship, moving away from Earth at a speed of  $0.9c$ , reports back by transmitting a signal at a frequency (measured in the spaceship frame) of  $100 \text{ MHz}$ . **To what frequency** must Earth receivers be tuned to receive the report?

(b) If the source is receding directly from the observer:

Then,  $\theta = \pi$  and  $\cos \theta = -1$   $\Rightarrow$   $f_o = f_s \frac{1}{\gamma(1 + \beta)}$  where,  $\gamma = \frac{1}{\sqrt{1 - \beta^2}}$

$$\Rightarrow f_o = f_s \sqrt{\frac{1 - \beta}{1 + \beta}}$$

$$\beta = \frac{v}{c}$$

$$\beta = \frac{0.9c}{c}$$

$$f_s = 100 \text{ MHz}$$

$$f_o = f_s \sqrt{\frac{1 - \beta}{1 + \beta}} = ?$$

**Answer all questions**

---

Assume, velocity of Light ( $c$ ) =  $3 \times 10^8 \text{ ms}^{-1}$

- 01.** Particle X, which is created in a particle accelerator, travels a total distance of  $100.0 \text{ m}$  between two detectors in  $410 \text{ ns}$  as measured in the laboratory frame before decaying into other particles.

What is the lifetime of the particle X as measured in its own frame.

**(15 Marks)**

Velocity of the particle X w.r.t lab frame :

$$v = \frac{\text{distance}}{\text{time}}$$

$$v = \frac{100 \text{ m}}{410 \text{ ns}}$$

$$v = 2.44 \times 10^8 \text{ ms}^{-1}$$

Using relativistic time equation :

$$t_2 = t_1 \frac{1}{\sqrt{1 - \frac{v^2}{c^2}}}$$

$$t_1 = ?$$

$$t_2 = 410 \times 10^{-9} \text{ s}$$

$$v = 2.44 \times 10^8 \text{ ms}^{-1}$$

$$t_1 = t_2 \sqrt{1 - \frac{v^2}{c^2}}$$

$$t_1 = 410 \sqrt{1 - \frac{(2.44 \times 10^8)^2}{(3.0 \times 10^8)^2}}$$

$$t_1 = 238 \text{ ns}$$

02.

An ellipse having an area  $\pi ab$  is projected with a certain velocity. It was observed that the ellipse appears as a circle of area  $\pi b^2$ . Determine the velocity of projection of the ellipse. (Where,  $a > b$ .)

**(15 Marks)**

$$l^1 = l \sqrt{1 - \frac{v^2}{c^2}}$$

$$l = a \quad \text{and} \quad l' = b$$

$$b = a \sqrt{1 - \frac{v^2}{c^2}}$$

$$b^2 = a^2 \left(1 - \frac{v^2}{c^2}\right)$$

$$\frac{v^2}{c^2} a^2 = a^2 - b^2$$

$$v^2 = c^2 \frac{a^2 - b^2}{a^2}$$

$$v = \frac{c}{a} \sqrt{a^2 - b^2}$$

**03.** Let A be the twin on the earth and B be the twin in the ship in the twin paradox episode. Comment on the following statement using your knowledge of special theory of relativity.

**“The twin B can go to the future, but can not go to the past”**

**(15 Marks)**

**“The twin B can go to the FUTURE, but can not go to the PAST”**

What is FUTURE ?

What is PAST ?

“The twin B can go to the FUTURE; but not his own FUTURE and its other one’s FUTURE !!!

“The twin B can not go to the PAST”; according to the Relativity (STR) time can not negative !!!

- 04.** A spacecraft moves towards the Earth with velocity  $\frac{c}{2}$  as viewed from Earth's frame. The spacecraft emits light of wave length  $\lambda$  as measured in its own frame. The wave length of light as seen by an observer on the Earth is 6000 Å. (1 Å =  $10^{-10}$  m)

Find the value of  $\lambda$ .

*{You may assume that the relationship between the observed frequency and the source frequency for the above case takes the following form;*

$$f_o = \frac{f_s}{\gamma (1 - \beta \cos\theta)}$$

*Where,  $\gamma = \frac{1}{\sqrt{1 - \beta^2}}$ ,  $\beta = \frac{v}{c}$  and other symbols have their usual meanings. }*

**(15 Marks)**

A spacecraft moves towards the Earth with velocity  $\frac{c}{2}$  as viewed from Earth's frame. The spacecraft emits light of wave length  $\lambda$  as measured in its own frame. The wave length of light as seen by an observer on the Earth is 6000 Å. (1 Å =  $10^{-10}$  m)

Find the value of  $\lambda$ .

(a) If the source is directly approaching the observer:

Then,  $\theta = 0$  and  $\cos \theta = 1$   $\rightarrow$   $f_o = f_s \frac{1}{\gamma(1-\beta)}$  where,  $\gamma = \frac{1}{\sqrt{1-\beta^2}}$

$$\rightarrow f_o = f_s \sqrt{\frac{1+\beta}{1-\beta}}$$

$$\beta = \frac{v}{c}$$

A spacecraft moves towards the Earth with velocity  $\frac{c}{2}$  as viewed from Earth's frame. The spacecraft emits light of wave length  $\lambda$  as measured in its own frame. The wave length of light as seen by an observer on the Earth is  $6000 \text{ \AA}$ . ( $1 \text{ \AA} = 10^{-10} \text{ m}$ )

Find the value of  $\lambda$ .

$$f_o = f_s \sqrt{\frac{1+\beta}{1-\beta}}$$

$$\beta = \frac{c/2}{c}$$

&

$$f_s = \frac{c}{\lambda}$$

and

$$f_o = \frac{c}{6000 \text{ \AA}}$$

$$C = f \lambda$$

$$f_s = \frac{C}{\lambda}$$

and

$$f_o = \frac{C}{6000 \text{ \AA}}$$

$$\frac{C}{6000 \text{ \AA}} = \frac{C}{\lambda \text{ \AA}} \sqrt{\frac{1-\beta}{1+\beta}} \rightarrow \lambda \Rightarrow$$

can be calculated !!!

*Thank You !*
